

Guedel Airways

Our Guedel Airways are designed for free air flow.

By protecting from airway occlusion from the relaxation of the tongue in an unconscious patient.

Our Guedel Airway devices have a central lumen which allows for various suction catheters to be inserted.

The top section has a colour coded section for rapid identifying of size as well as a thickened area for protection from biting. This bite block is ideal for patients with seizures and unprotected airways. Also it has benefits for the intubated patient disallowing them from crushing the endotracheal tube.

There are various sizes available from neonate to large adult. It is important to choose the right size; the size of the Guedel airway is the length between the corner of the mouth and the ear lobe. It is inserted into the patient's mouth upward while holding the tongue, and rotated when introduced to point downward.

Features

- Features airway and bite block for airway management
- Consists of a large flange, a reinforced bite portion, and a gentle curve that follows the contour of the tongue
- Colour code for size identification conforms to ISO requirements
- Meets ISO-10993:1997 for biocompatibility requirements
- Sold individually
